

Progress Diary — PIC Project 1

Automatically compiled from project updates — no manual entry required.

Convention for any session working in this project: when you make a durable change here — a decision, a pivot, a new doc, a build milestone, an open question resolved — append a short dated entry below (newest date at the top; new entries within today's date append under that date's heading). Keep entries factual and terse: what changed and why, not a full recap. A daily scheduled task reads this file and republishes it as `progress-diary.pdf` in the project whenever new entries appear.

2026-09-03

- Kunwoo proposed **DoJeon** (도전, Korean for "challenge") as the public app name, tying directly to PIC's slogan "Challenge Everything, Fear Nothing." "Beast Mode" stays the internal engineering codename until the App Store Connect uniqueness check clears — that check remains an open decision.
- A club-president-facing proposal doc ("DoJeon - PIC Club Proposal.docx") condensing the outline into a readable, non-technical pitch was drafted and sent to Kunwoo for review, ahead of him forwarding it for club confirmation.

- Set up this progress diary and the automated daily PDF digest that keeps it as a clean, shareable PDF without anyone needing to type updates by hand.
- State of the project as of today: pivoted from **VoiMo** (a voice-recognition note-taking app) to **Beast Mode**, an extreme-goal planner tied to PIC's "Challenge Everything, Fear Nothing" slogan, built around a **Forge** → **Proof** → **Stakes** loop with small accountability pods (3–6 people). VoiMo's plan is shelved, not deleted, and its iOS/Xcode/Swift/AVFoundation/Claude-API groundwork carries over into Beast Mode.
- Open decisions still flagged for Kunwoo: final app name (Apple uniqueness check pending), pod formation model (invite-only vs. auto-matched), real-money vs. symbolic stakes (symbolic for MVP), proof photo/voice privacy disclosure, and backend lock-in (Supabase recommended over CloudKit for multi-user pod queries).
- Beast Mode outline revised twice (V1 → V2 → V3), each round driven by specific calls from Kunwoo. Core loop is now **Forge** → **Push** → **Proof** → **Adjust** (Push replaces the earlier undifferentiated "session" idea; Stakes is dropped as a named stage). Real-money/punitive stakes and any cross-squad leaderboard are ruled out entirely, not deferred — squad presence itself is the motivator (an "eusya-eusya"-style group cheer, i.e. a group challenge of individual goals).
- Push now has a concrete session flow: choose task/output → start a timer → squad can optionally join live (no video call) → submit output or log a blocker → see a squad summary. Async participation is the default since a 3–6 person squad won't always overlap live.

- Solo mode was walked back from "deliberately weaker": it now runs the complete Forge → Push → Proof → Adjust loop with nothing crippled; squad remains the strong recommendation but isn't required.
- Today screen redesigned to lead with next deliverable, milestone progress, deadline status, and next session rather than a streak count. History now distinguishes four event types (not completed, completed-but-unproven, planned rest, session interrupted) instead of one blanket "miss."
- Adjust stage got explicit guardrails so replanning can't quietly postpone the goal: check for recovery room first, only present scope/time/deadline tradeoffs when the goal genuinely no longer fits, require approval, keep both the original and revised commitment visible, and force a full review after repeated Minimum-only days.
- Privacy rules for Proof are now defined rather than open: squad always sees status; the evidence file itself is opt-in per submission; live-session visibility is opt-in per session; leaving a squad or removing evidence can't rewrite the honest historical record.
- Backend choice settled: Supabase (Postgres + Auth), not CloudKit, from the first real feature — needed for multi-user squad queries.
- Full interactive build manual published as an Artifact ("Beast Mode Field Manual"); the superseded V1 manual is kept for reference, not deleted.
- Kunwoo's call at the end of the V3 review: stop expanding the outline and prototype one complete mission loop (Forge → Push → Proof → Adjust, solo) end to end next.
- Remaining open decisions: final app name + App Store Connect uniqueness check (unchanged), squad formation model (invite-only vs. auto-matched), squad size default (keep 3–6 vs. narrow for a first PIC cohort test), and session cadence (fixed shared windows vs. fully flexible per-member scheduling). Solo/proof privacy and backend choice are no longer open — both settled above.
